                                                                                                                                                                                                                                                                                                                          The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels,

The invention relates to a nucleic acid molecule which down regulates coppression of a CD20 gene and a nucleic acid molecule which down CC regulates expression of a neurite growth inhibitor gene (NOGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (aleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a NGN triplet), a zinzyme CC motif) pr an amberzyme (cleaving RNA with a NGN triplet), a zinzyme CC coleaver RNA of CD20 in the presence of a divalent cation that is CC preferably Mg.2^+. Furthermore, it may be contacted with a cell to reduce CC cD20 activity of the cell and treat a patient having a condition CC associated with the level of CD20. The treatment may further comprise the CC use of one or more therapies. In particular, the CD20 targetting CC lymphoma. low-grade or follicular NnL, lymphoma, leukaemia, B-cell lymphoma (NnL), bulky Clymphoma. low-grade or follicular non-Hodgkin's lymphoma (NnL), bulky CC lymphoma low-grade or follicular NnL, lymphocytic leukaemia, HIV (human cC immunocytoma (IMC), small B-cell lymphoma, limmune CC immunocytoma (IMC), small B-cell lymphoma, limmune (CC immunocytoma (IMC), small B-cell lymphocytic leukaemia, immune CC divalent cation that is preferably Mg.2^+. Furthermore, the nucleic acid contacted with a cell to reduce NOGO gene in the presence of a creatment may further comprise the use of one or more therapies.

CC treat a patient having a condition associated with the level of NOGO. The treatment having a condition associated with the level of CVA.

CC central nervous system (NOGO targetting nucleic acid may be used to treat (NOGO. The central nervous system (NOGO. The value acident (CVA.)
                       disease, muscure, states which respond to the modura states which respond to the modura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-FEB-2000;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO).

The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN cleaving NA with a NYN with a NYN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   11-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC use of one or more therapies. In particular, the CD20 targetting CC nucleic acid may be used to treat lymphoma, lukaemia, B-cell (Inmphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky CC low-grade or follicular NHL, lymphocytic leukaemia, HV (human CC immunocytcoma (IMC), small B-cell lymphocytic lymphoma (immune CC immunocytcoma (immunocytcoma compania, and inflammatory arthropathy. The NOGO targetting CC uncleic acid is used to cleave RNA of the NOGO gene in the presence of a CC divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and CC treat a patient having a condition associated with the level of NOGO. The CC in particular, the NOGO-targetting nucleic acid may be used to treat comprise the use of one or more therapies. CC in particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, Stroke), Alzheimer's disease, dementia, multiple sclerosis (NS), CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), CC chamotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), CC parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob CC disease, muscular dystrophy, and/or other neurodegenerative disease CC states which respond to the modulation of NOGO expression. The CC parkinson's account dystrophy and companies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC CD20 activity of the cell and treat a patient having a condition
CC associated with the level of CD20. The treatment may further comprise the
CC use of one or more therapies. In particular, the CD20 targetting
CC nucleic acid may be used to treat lymphoma, leukaemia, B-cell
CC lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky
CC low-grade or follicular NHL, lymphocytic leukaemia, B-cell
CC immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL),
CC immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune
CC include acid is used to cleave RNA of the NOGO gene in the presence of a
CC divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid
CC may be contacted with a cell to reduce NOGO activity of the cell and
CC treat a patient having a condition associated with the level of NOGO. The
CC in particular, the NOGO-targetting nucleic acid may be used to treat
CC central nervous system (CNS) injury and cerebrovascular accident (CVA,
Stroke), Alzheimer's disease, demantia, multiple sclerosis (MS),
CC parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The
CC present sequence is an amberzyme molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG 20-th Furthermore, it may be contacted with a cell to reduce the contacted with a cell to contacted with a cell to contact the contact the contacted with a cell to contact the co

HTPL

CC has two isoforms, with a few single base pair differences between the

Ct wo. One of the single base pair changes introduces a premature stop

CC shares an overall structure organisation with the Patched protein. The

CC shares an overall structure organisation with the Patched protein. The

CC shares an overall structure organisation with the Patched protein. The

CC important in regulating male germ cell development, and the HTPL is

CC import to human chromosome 10pl2.1. HTPL and its coding sequence are

CC compand to human chromosome 10pl2.1. HTPL and its coding sequence are

CC thorapy and manufacture of a medicament for treatment or prevention of

CC thorapy and manufacture of a medicament for treatment or activity of human

CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,

CC skeletal muscle or colon function. HTPL proteins and nucleic acids are

CC clinically useful diagnostic markers and potenial therapeutic agents for

CC male infertility and cancer. The present oligonucleotide was used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-JAN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-L (L for long). HTPL become in the compared to HTPL-L (L for long).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human testis expressed Patched like protein useful for identifying agonist and antagonist and specific partners, and for treating subjects having defects in HTPL

                                                                                                                                                                            밁
                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                           The invention relates to an isolated SH3 domain (POSH)-like signalling CC protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino cc acids (SI, ABBB399), a sequence having 65% sequence identity to (S1), CC (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. CHuman POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (1) and nucleic acids (II) cencoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating creating cance is that of a scanning oligonucleotide useful in examples of the invention.
                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                     protein 1 (POSHI 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHI 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHII including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The

The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of CC hGDMLP-1 can be used in gene therapy and vaccine production. The CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC hGDMLP-1 nucleic acids can be used as probes to detect, characterise CC and quantify hGDMLP-1 nucleic acids in samples, as amplification CC substrates, to provide initial substrates for the recombinant engineering CC of hGDMLP-1 protein variants having desired phenotypic improvements, and CC for expressing the proteins. The hGDMLP-1 proteins or polypeptides may CC be used as immunogens to raise antibodies that specifically recognise CC hGDMLP-1 proteins, as standards in assays used to determine the CC concentration and/or amount specifically of hGDMLP proteins, as specific CC deficiency in hGDMLP-1 production, and in vaccines or for replacement CC diagnosing a disorder associated with the expression of hGDMLP-1, in CC chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-JAN-2001;

                  of hdDMLP-1 protein variants having desired phenotypic improvements, an for expressing the proteins. The hdDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hdDMLP-1 proteins, as standards in assays used to determine the hdDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hdDMLP proteins, as specifically of hdDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific
                                                                                                                                                                            The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gen therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering the property of the provide initial substrates for the recombinant engineering the provide initial substrates for the provide ini

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N.B. The sequence data for this patent did not specification, but was obtained in electronic i at ftp.wipo.int/pub/published_pct_sequence.
                                                     New polypeptide, for raising antibodies that proteins, or as specific biomolecule capture surface enhanced laser desorption ionization,

cc phosphorothicate linkages on a terminus, or a combination of any two or combre of these modifications. The oligonucleotides are useful for cdirecting repair or alteration of plant genetic information. The coligonucleotides are particularly useful for creating plants with desired content open and the content of plants or altering amino acid content of plants or conferring amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. cglyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance), cc disease resistance, modified oil production, modified starch production ce.g. increased starch or production of waxy starch), altered floral comphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). Cf he oligonucleotides are also useful for producing albino mutants for the canalysis of photosynthetic processes. This sequence represents a genome creating oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide for targeted alteration genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production -

                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an oligonucleotide for targeted alteration of a CC genetic sequence, which comprises a single-stranded oligonucleotide CC having a DNA domain. The DNA domain has at least one mismatch with CC respect to the genetic sequence to be altered and further comprises CC chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications CC consist of o-methyl modification, an LNA modification, two or more CC disponsible to these modifications. The oligonucleotides are useful for CC directing repair or alteration of plant genetic information. The CC disponucleotides are particularly useful for creating plants with desired CC phenotypes, e.g. environmental or abiotic stress tolerance, improved CC untritional value (e.g. altering amino acid content of plants or CC conferring amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinone and sulphonylurea herbicide CC disease resistance, modified oil production, modified starch production CC (e.g. increased starch or production of waxy starch), altered floral CC (e.g. reduced palmitate, increased starate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the CC analysis of photosynthetic processes. This sequence represents a genome CC altering oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

sequence that hybridizes to them under highly stringent conditions, or che complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, c.g. as one component of a gene chip, in vitro as (anti) sense reagents, can for production of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in gatient samples is useful for diagnosis and/or prognosis of these chips. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                          Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme;

                                                                                                                                                                                                                                                                                                                               The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor (kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme (configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A. gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oseophageal, stomach, bladder, pancreatic, correctal, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, colorentes or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, chesity, astchman, crohn's disease, diabetes,
                                                                                    Matches
                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-AUG-1994;

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66530 - ABZ66531 represent substrate/target sequences for the human ribozymes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-MAY-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 15;
                                                    The sequences given in AATO5636-39 are primers which were used construction of a mutated factor VIII molecule. The amplified encodes a molecule in which Arg 562 is substituted for Ile. The mutation occurs in the cleavage site for activated protein C (A confers resistace to APC cleavage. The novel factor VIII based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The primers (AAQ48987-Q49045) are used in the amplification of Kappa and lambda-chain genes of various antibodies. These genes are then recombined into the same replicon, resulting in very diverse libraries of antibody chains, e.g. from unimmunised donors. It is also useful for chain shuffling, mutagenesis, humanising and CDR imprinting. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                             substitution; factor V; acti resistance; thrombo-embolic

                                       some or all of the following elements: purification tag:proteinase site:ECM binding site:proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.
                                                                                                                                                                                                                                                                                                                                              A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed purification tag.

Additionally, the fusion protein may comprise proteinase-sensitive highest sites and binding domain so the protein sequence may contain the protein the protein sequence may contain the protein the protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT71737

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                           ErbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while oligonucleotides AAV4872-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosine; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive consecutive and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by ZR/JR = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, junB, junD, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or by the contain the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of primary cell cultures (e.g. bone marrow stem, liver or by the contains of the 
                                                                                                                                                                                                 kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preparation of antisense oligo:nucleotide(s) which lack long runs consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                       Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to new influenza antigens that comprise a fusion product of at least the extracellular part of a conserved influenza membrane protein (or a functional fragment) and a presenting carrier. The membrane protein consists of the extracellular part of the influenza matigens can be used in the preparation of a vaccine against influenza for humans and animals, e.g. pigs and horses. The vaccines can be direct vaccines, e.g. vaccines containing the fusion

The bone morphogenetic fusion protein may contain some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active

cc and oncogene products. PIJKS act as downstream effectors of these creeptors, are recruited upon receptor stimulation and mediate the cc activation of second messenger signaling pathways. The PIJ kinase cray consists of a 110kD catalytic subunit (p10) associated with cc an 85kD regulatory subunit (p85) and it is through the SH2 domains co f the p85 subunit that the enzyme associates with the membrane cc bound receptors. PIJKs have been implicated in many cellular cc activities including growth factor mediated cell transformation, cc mitogenesis, protein trafficking, cell survival and proliferation. CC mitogenesis, protein trafficking, cell survival and proliferation. CC places transport. Antisense compounds directed against PIJK p85 and cc which inhibit its expression are useful as diagnostics and research cc reagents, and as a component of kits, which can be used for detecting ct the level of pIJK p85 in a sample. The compounds may be administered to be treated by modulating the expression of PIJK p85. The compounds may be administered can be treated by modulating the expression of PIJK p85. The compounds may cc further be useful prophylactically, e.g., to prevent or delay confection, inflammation or tumour formation. The target site of the pIJK p85 subunit (See GENESEQ record AAA52007).

G-alpha-16 is a human G protein which interacts differentially with several receptor types including members of the opicid and chemokine receptor families. A series of antisense oligonucleotides have been designed to target different regions of the human G-alpha-16 RNA. They may be used to inhibit the expression of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G-alpha-16 in human cells and tissues and thus to treat diseases associated with G-alpha-16, such as hyperproliferative disorders, especially cancer. Infections, inflammation or tumour formation car be prevented or delayed. The compounds can be used in research and diagnostics in sandwich and other assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A new antisense compound for inhibiting the expression of human G-alpha-16 and treating, preventing or delaying infections, inflammation or hyperproliferative disorders such as cancer -
                                                                                                                                                                                                                                                                                                            19-JUN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence has a phosphorothicate backbone and may be either an oligodeoxynuclectide or a chimeric oligonuclectide containing 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. The ISIS number given above corresponds to the oligodeoxynuclectide sequence

partially secreted, i.e., transmembrane proteins. The proteins of the invention may exhibit one or more activities selected from the following cytokine activity; cell proliferation; differentiation; immune modulation; haematopoiesis regulation; tissue growth activity; haematopoiesis regulation; tissue growth activity; activin/inhibin activity; chemotactic/chemokinetic activity; haemostatic and thrombolytic activity; anti-inflammatory activity; and tumour inhibition activity. The proteins may be administered to patients as vaccines, and the nucleotides may be used as near of constitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-NOV-1998;

                                                                                                                                                                                        vaccines, and the nucleotides may be used as part of a gene therapy regime. Diseases or conditions that may be treated using the proteins or nucleotides of the invention include autoimmune diseases; genetic disorders; haemophilia; cardiovascular diseases; cancer; bacterial, fungal and viral infections, especially HIV; multiple sclerosis; rheumatoid arthritis; pulmonary inflammation; Guillain-Barre syndrome; insulin dependent diabetes mellitus; and allergic reactions such as asthma and anaemia. They may also be used for treating wounds, burns, ulcers, osteoporosis, osteoparthritis, periodontal diseases, Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis (ALS). Proteins with activin/inhbin activity may additional activity may additional disease.
                                          Sequence 18
                                                                                                         additionally be useful as contraceptives. Nucleic acid sequences of the invention may be used in chromosome mapping, and as a source of diagnostic primers and probes. Sequences AAA23463-A23502 represent hybridisation probes which may be used to isolate the cDNA clones of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to 40 human secreted proteins (AAY9498 and cDNA sequences encoding them (AAA23423-A23462). The secreteins of the invention include those that are thought to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 345;

The fusion construct is placed downstream of a Bacillus species promoter sequence. This sequence represents an oligonucleotide coding for the (His)6 part of the construct WMPsp.WMPmp10-(His)6-Linker-Wet-ProInsulin. This construct comprises the Bacillus brevis middle wall protein mp10 linked to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
         NNA complex in presence of the test compound and comparing the result with a standard. The oligonuclectides AAZ59070-Z59071 anneal to form a double stranded oligonuclectide containing the HIV-1 trans-activation regulatory region (TAR) to which the HIV-1 Tat protein binds. The complex is labelled with 6-carboxyfluorescein and is used as a target for the binding of a labelled ADP-1 protein. Detection of the complex is by fluorescence resonance energy transfer (FRET). The method is used to identify compounds that interfere with interaction between the target RNA and ligands or proteins. Compounds that are identified are potentially useful for treating infections (viral, bacterial or fungal), cancer and autoimmune diseases. The compounds are preferably directed to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a DNA construct encoding a fusion protein comprising a Bacillus species cell wall protein fused to a cleavage peptide and a heterologous protein. The fusion construct is placed downstream of a Bacillus species promoter sequence. This sequence represents a reverse oligonuclectide coding for the (His) 6 part of the construct MMPsp.MMPmp10-(His)6-Linker-Met-ProInsulin. This construct comprises the Bacillus brevis middle wall protein mp10 linked to the proinsulin protein via a cleavable linker sequence.
                                                                                                                                                                                                                        The invention relates to a method of determining if a compound binds to a target RNA by treating a test compound with a reporter (R) labelled with a donor or acceptor group and labelled target RNA, labelled with the complementary donor or acceptor group, and measuring the fluorescence from fluorescent groups associated with a compound:target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 18 BP; 5 A; 0 C; 7 G; 6 T; 0 other;

                                                                                                                                                                   This invention describes novel antisense oligonucleotides (I) capable of inhibiting expression of human EGR-1 (early growth response-1). The products of the invention have anti-inflammatory, cytostatic and antiviral activity. (I) was tested for its effects on EGR-1 mRNA levels by real-time polymerase chain reaction (PCR), results indicated that 60% inhibition was achieved. When (I) was modified by 2'-O-methoxyethyl substitution of the first 4 and last 4 residues, and by replacing any C in these flanking regions with 5-methyl-C, the degree of inhibition was increased to 71%. (I) is used to inhibit expression of EGR-1 in cells and tissues in vitro, for research or diagnosis, e.g. detecting EGR-1 encoding nucleic acid. (I) may also be used to treat or prevent and these thanking particularly vital infections, inflammation and these and the prevent and the seases, particularly vital infections.
                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotides that inhibit expression of human early growth response-1, useful for diagnosis, treatment and prevention tumors, inflammation and infection -

                                                                                                                                                                                                                                                                                                      uses sets of peptide nucleic acid (PNA) probes in hybridisation reactions. The method comprises using at least 2 sets of hybridisation probes, where at least one set comprises one or more PNA probes capable of hybridising to specific nucleic acid sequences related to a potential aberration in a chromosome. The methods can be used for the detection of chromosome aberrations. They can be used for the diagnosis of disorders and diseases related to chromosomal aberrations or abnormalities such as e.g. haemapoietic malignancies, cancers and inborn constituel diseases. The method may be used for detecting viral sequences and their localization in the chromosome. In plant biology, the methods can be used for monitoring the efficiency of transferring herbicide resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAZ36520-41 (set 1) and AAZ36542-61 (set 2) represent two sets of probes which flank each site of the major breakpoint region (mbr) of the MLL-1 gene. The MLL gene is associated with acute lymphoblastic leukaemia-1 (ALL-1). The probes are selected from the lower strand of the MLL-1 gene, and so hybridise to the upper strand. The probes are used to demonstrate the method of the invention. The specification describes a method for the detection of chromosome aberrations in eukaryotic samples
                                                                                                                                                                                                                              Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of chromosome aberrations, used for detecting diseases and disorders, infections, and plant alterations related to e.g. herbicide
                                                                                                                                                                                                                                                                                       genes to a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 40; 63pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2000-038821/03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pluzek K, Nielsen KV,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-MAY-1998;

                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                        The present invention describes isolated nucleic acids encoding secreted polypeptides, designated PROX polypeptides (i.e. a PRO polypeptide where X is an integer from 1 to 17). PROX polypeptides have cytostatic, immunomodulatory and reproduction activities, and can be used in gene therapy, and as PROX antagonists and PROX agonists. PROX polypeptides, nucleic acids and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a PROX-associated disorder, e.g. a cell proliferation and/or differentiation aldorder (e.g. pre-clampsia). They are also used for screening for a modulator of activity or of latency or predisposition to a PROX-associated disorder. AAF74432 to AAF74448 encode the specifically claimed human PROX polypeptides PRO1 to PRO17 given in AAB70531 to AAB70547. The present reguence represents a primer used in an example from the present
                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes isolated nucleic acids encoding secreted polypeptides, designated PROX polypeptides (i.e. a PRO polypeptide where X is an integer from 1 to 17). PROX polypeptides have cytostatic, immunomodulatory and reproduction activities, and can be used in gene therapy, and as PROX antagonists and PROX agonists. PROX polypeptides, nucleic acids and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a PROX-associated disorder, e.g. a cell proliferation and/or differentiational disease (e.g. cancer or immune associated disorders) and a gestational disease (e.g. pre-clampsia). They are also used for screening for a modulator of activity or of latency or predisposition to a PROX-associated disorder. AAF74432 to AAF74448 encode the specifically claimed human PROX polypeptides PRO1 to PRO17 given in AAB70531 to AAB70547. The present requence represents a primer used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding secreted polypeptides, designated PROX polypeptides, useful for treating a syndrome associated with PROX-associated disorder, e.g. cancer -

The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and

Antisense compounds of the invention are used for treating obesity. Type 2 diabetes and hyperproliferative condition e.g. cancer. They may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. Antisense compounds either alone or in combination with other antisense compounds or therapeutics can be used as tools in differential and/or combinatorial analyses to elucidate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas for cornea, susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pancreas, Langerhans islet in pancreas and cornea, suscept diagnosis of genetic diseases and identifying individuals.
The present invention

relaxin/IGF/insulin family and their amides, esters and salts. These play a key role in metabolic regulation, especially of usage of energy sources such as sugars and lipids. The sequences can be used to prevent, treat and diagnose metabolic disorders, including disorders of the growth, proliferation and differentiation of tissues, functional lowering of reproductive functions, abnormalities of the formation of connective tissue, fibroidosis of lung, kidney or other organs, obstruction of blood circulation and internal secretions, abnormalities of body fluid balance, neurological disorders, immune disorders, scleroderma and suppression of
                                              neurological disorders, immune disorders, scleroderma and sugangiogenesis. The present sequence is a PCR primer described exemplification of the invention.

CC The sp
CC The sp The specification describes a method for determining whether a product of a gene is involved in preventing a replication error in a cell. The method comprises providing the cell with a specific inhibitor for the product and determining the level of functional expression of a marker gene in the cell, where the level of expression of the marker gene is dependent on the occurrence of the replication error. The method is used for determining whether a product of a gene is involved in preventing a replication error in a cell. The identified genes are useful for developing diagnostic tools, or as targets for drug development to manipulate cells on the basis of the presence or absence of function of the gene. Primers ABZ23504-15 were used for PCR and sequencing to analyse microsatellite instability in mesh-6 worms, in the course of the invention. Determining whether a product of a gene is involved in preventing a replication error in a cell comprises providing a specific inhibitor for the product and determining the level of expression of a marker Example 1; Page 19; 47pp; English or absence

                                                                                                                  AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences can also be used in a method colon ilbraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the colonosis, prognosis and treatment of cancer.

                                                                                                                                                                                                                                         The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45133-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other threatless.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; kelo skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasi IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris growth factor mediated cell proliferation; ichthyosis; serborrhoea; ru
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can invention (see AAF45151 and AAF4513-F4616). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood users!

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of ARF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, hyperneovascular condition of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an cantisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBp]-2 or IGFBp2), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, configuration and/or other disorders. The present sequence is an coligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, inthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the cretina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisuccleic acid that inhibits or reduces growth factor mediated cell
                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or chairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepaticellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site

AAV48709-886 represent antisense oligonucleotides directed against the ErbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while oligonucleotides AAV48792-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides able to form three H-bonds to three consecutive nucleotides able to form three H-bonds to three consecutive nucleotides able to form three H-bonds to three consecutive
                                                                                                                                                                                                                                                                                                                                                                                     Preparation of antisense oligo:nucleotide(s) which lack long runs consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, junB, junD, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonuclootides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.
                                                                                                                                                                                                                                                                                           Beigelman L, Karpeisky A, I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
```

The present invention describes a novel enzymatic having a hammerhead motif (HM) comprising: (i) at

nucleic least 5

acid (ENA) ribose

307pp;

English

Enzymatic nucleic acid molecules having a for the treatment of arthritis, induction treatment of auto-immune diseases

hammer-head motif - of graft tolerance o

WPI; 1996-300653/30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) a 1 least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. CC The ENA's can inhibit collagenase and stromelysin production in the cc symovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for cenhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly expression in the present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The present sequence is that of a PCR primer used for isolating the 3'-end of a cDNA sequence coding for the human protease designated T which is related to the interleukin-1 beta converting enzyme (ICB) and which induces apoptosis. First, a 600 bp fragment of the coding sequence was isolated from human monocyte cDNA using primers based on the sequence of a human genomic fragment which was 92% identical the exon 6 sequence of the human ICE gene. Then, the 5'- and 3'-ends were amplified using the Rapid Amplification of cDNA Ends (RACE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       induction; inflammation; autoimmune disease; neurodegeneration;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           technique. The Tx protease convert. 20 kD and 10 kD fragments and can l respond to ICE, e.g. inflammation. useful for treating cancer.
                                                                                                                                                                                                        A series of primers (AAT35236-49) were used to sequence natural killer lytic associated protein clones (see also AAT35233) in pBluescript. Confirmation of the sequence of the 5' G-C rich region of the NKLAP gene was performed subsequent to subcloning of the clones into M13 phage. A single open reading frame coding for a 587-amino acid protein (AAR99256) was revealed.

Best Local :
tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain contricion.
                                                                                                                                                                                                                                                                                                                                                                                        the Synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGP). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ANX67275 to NAX75552 represent specific examples

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                          Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antiporiatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
